PROBLEM TO BE SOLVED: To provide an apparatus system in which it is not required to scan the readout part of a reader on an inspection plate manufactured by using a DNA microarray or the like and by which a reaction result on the face, to be measured, of the inspection plate can be detected at a time as an image and to provide an optical system used for the apparatus system. SOLUTION: The optical system wherein a CCD image sensor and a fiber face plate are combined with an optical system constituting the readout part in the reader of a light emitting image which is used to detect the existence of the reaction of a probe array with a sample on a transparent substrate as the existence of a light emitting operation is used.
